Brian Eng

(646) 510-6063 | brianeng87@gmail.com | linkedin.com/in/brianeng00 | github.com/brianeng00 | brianinteractive.com | Nutley, NJ

PROFESSIONAL SUMMARY

Senior frontend engineer with 11+ years in TypeScript, JavaScript, and the DOM across established, high-traffic codebases. Builds fast, accessible, responsive product UI with close attention to interaction detail, and sets the standards teams build on: shared patterns, code review, and testing. Framework-agnostic by way of browser-layer depth: 4 years production Ember.js, now building in React and TypeScript. Uses AI coding agents daily (Claude Code, Google's Antigravity) to prototype and ship faster, reviewing everything before it ships. At Wunderkind (2019-2025), owned the team's shared integration library, built a React and TypeScript Chrome extension that cut integration testing time by 70%, and held zero Core Web Vitals degradation across client sites serving millions. Treats WCAG accessibility and performance as hard constraints, not goals. Portfolio: brianinteractive.com

CORE COMPETENCIES

TypeScript & JavaScript | React & Ember.js | Component Architecture | Accessibility (WCAG) | Performance (Core Web Vitals) | Unit & E2E Testing | Storybook & Figma | AI-Assisted Development | Technical Mentorship

WORK EXPERIENCE

Independent

Dec 2025 - Present

Self-Directed Engineering | Remote

- Built and shipped **FlightTrack**, a real-time flight tracker SPA in **React 19 and TypeScript**: custom hooks for polling and geolocation, dead-reckoning interpolation at 10fps between polls, adaptive early-poll on position divergence, and a defensive fallback chain for geolocation, rate limits, and missing WebGL. **Unit tests in Vitest and React Testing Library, end-to-end in Playwright**
- Architected a **multi-agent development workflow** spanning Google's Antigravity IDE (Gemini Pro) and Claude Code, delegating discrete implementation tasks across two vendor AI ecosystems while retaining review and correction authority over all shipped output
- Designed and built an **agentic evaluation pipeline** in Node.js that scans, scores, and tracks opportunities against a custom multi-factor framework; a zero-token scanner stage queries ATS REST APIs directly before any model call, keeping cost proportional to signal. **100+ roles evaluated** end to end
- Shipped a live event-scheduling board on a Google Sheets data layer with a self-hosted monitoring script, replacing a paid third-party service

Wunderkind | Remote

Aug 2019 - Dec 2025

Senior Software Engineer | Jan 2023 - Dec 2025

Software Engineer | Aug 2019 - Jan 2023

- Owned and maintained the team's shared integration library, driving **frontend architecture decisions** across the team: curated reusable patterns for recurring client-side problems, set the code review standards, and kept it current as new edge cases emerged
- Built a **React and TypeScript** Chrome extension as an internal dev tool for real-time live testing of embedded experiences on client sites: DevTools panel UI, content scripts for DOM injection, wired into the existing extension build pipeline. **Cut integration testing time by 70%**
- Partnered with Product, Design, and QA across the SDLC, ensuring **WCAG accessibility compliance**, responsive layouts, and established engineering standards on every deliverable
- Maintained **zero Core Web Vitals degradation** (LCP, CLS) across high-traffic client sites under strict delivery SLAs while shipping continuously
- Built an internal feature on a **legacy EmberJS platform** from zero documentation, eliminating a manual design-team workaround, reducing a 10-20 minute per-creative process to seconds (80% efficiency gain)
- Mentored engineers and accelerated new-hire ramp-up by 20% through standardized documentation and pairing on integration best practices

Tobii

May 2018 - Apr 2019

Front End Web Developer | New York, NY

- Built enterprise applications for large-scale quantitative research on a SaaS eye-tracking platform, managing **real-time data streams** from hardware eyetrackers and cameras
- Developed and standardized reusable AngularJS templates, ensuring cross-device and cross-browser compatibility for data collection applications
- Designed and executed **end-to-end automation test suites** using Selenium, BrowserStack, Jenkins, and AWS in adherence to TDD practices

Sticky (acquired by Tobii)

Feb 2014 - May 2018

Jr. Web Developer | New York, NY

- Built custom cross-browser responsive web experiences in JavaScript, jQuery, and Bootstrap with a focus on DOM manipulation and browser compatibility
- Integrated platform services with survey platforms (Qualtrics, SurveyGizmo, ConfirmIt) and data services (Salesforce, Google Analytics) via Python and Node.js REST API scripts

PROJECTS

FlightTrack

Open Source

Real-time flight tracker SPA in **React 19 and TypeScript**. Custom hooks for API polling and geolocation; dead-reckons aircraft positions at 10fps between 60s polls (spherical projection) so icons glide instead of jump; triggers an early poll when a projected position diverges past tolerance. Geolocation degrades GPS to IP to default, 429s back off with a live user-facing countdown, polling pauses via the Page Visibility API. Responsive sidebar-to-drawer below 768px. github.com/brianeng00/flight-track

React 19, TypeScript, Vite, MapLibre GL JS (WebGL), Vitest, React Testing Library, Playwright E2E

Top Bar Automator

Open Source

React and TypeScript Chrome extension for real-time live testing of embedded experiences on client sites. DevTools panel UI in React, content scripts for DOM injection, integrated with the extension's multi-entry Webpack build pipeline. github.com/brianeng00/top-bar-automator

React, TypeScript, Chrome Extension API, DOM injection, Webpack

Multi-Agent Development Workflow

Daily Driver

Google's Antigravity IDE (Gemini Pro) delegates discrete implementation tasks to Claude Code as a specialized coding agent, spanning two vendor ecosystems. Every unit of output is reviewed before it ships. The operating rule: never accept output I cannot explain.

Antigravity, Gemini Pro, Claude Code, multi-agent orchestration

career-ops

Agentic Pipeline

Scans, scores, and tracks opportunities against a custom multi-factor framework. A zero-token scanner stage hits Greenhouse, Ashby, and Lever REST APIs directly before any model call, keeping cost proportional to signal. 100+ roles evaluated, 126 structured reports generated.

Node.js, Playwright, REST APIs, Claude, YAML, batch orchestration

EDUCATION & CERTIFICATIONS

B.S. Integrated Digital Media, NYU School of Engineering

Web Accessibility (ud891), Udacity

Python Programming, General Assembly

SKILLS

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3, Python

Frameworks & Libraries: React 19 / v18, Ember.js (4 yrs production), Next.js concepts (SSR, hydration), AngularJS, jQuery, MapLibre GL (WebGL)

Design & Component Tooling: Storybook, Figma

APIs & Data: GraphQL, RESTful APIs, Node.js

Testing & CI/CD: Vitest, Jest, React Testing Library, Playwright (E2E), Selenium, BrowserStack, Jenkins, CircleCI, TDD, Webpack, Vite, Git

Browser & Platform: DOM manipulation, Web APIs, Chrome Extension API, cross-browser compatibility, embedded JS, third-party script delivery

Performance & Accessibility: Core Web Vitals, WCAG, Lighthouse, responsive layouts, SEO

AI & Agentic Tooling: Claude Code, Google Antigravity (Gemini Pro), Cursor, GitHub Copilot, Ollama, multi-agent orchestration, AWS EC2/Lightsail
